Build your own Dev Experience Upgrades with GitHub Copilot SDK

Renee Noble
Senior Developer Advocate

This example of building a GitHub issue triage and tagging system will show you how you can go beyond what Copilot does out of the box with the power of GitHub Copilot agentic workflows.

Agenda

1. What is the Copilot SDK?
2. Hello World: Your first SDK call
3. Building your agentic toolbox
4. Streaming to the browser
5. Ship it safely
6. Questions

What Is the Copilot SDK?

Copilot in your editor

Built into your IDE (chat, autocomplete)

Interactive - Suggests code and info when you type or chat

You see the results on screen

A tool for developers

Copilot SDK

A Python / JS / C# library you install

Your application calls it like any other library

Your code receives the results and does something with them

A building block for applications

The Agentic Loop

1. Initial Prompt Sent

"Analyse GitHub Issue"

2. Model Requests tool call

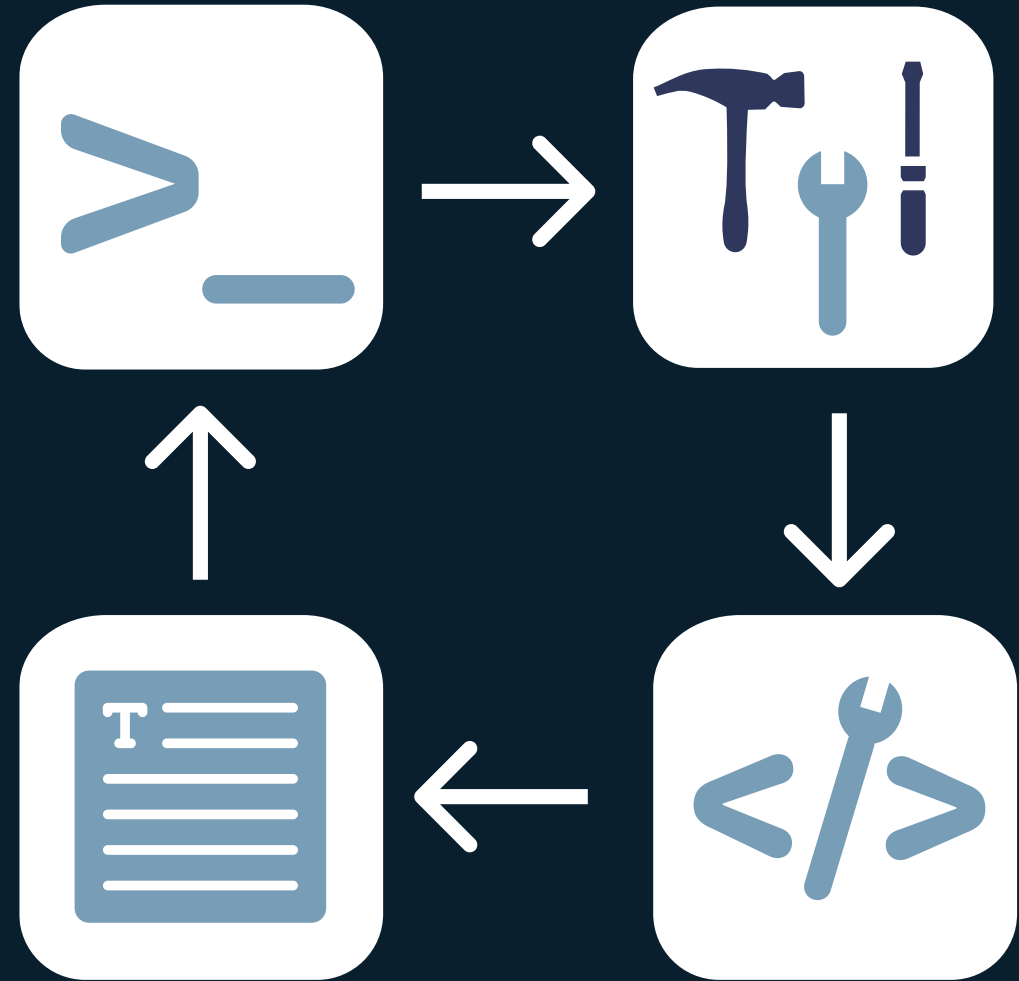

***Select** get_github_issue tool*

3. Tool Executes your code

***Run** get_github_issue code*

4. Results are returned

Model receives** tool output a **string

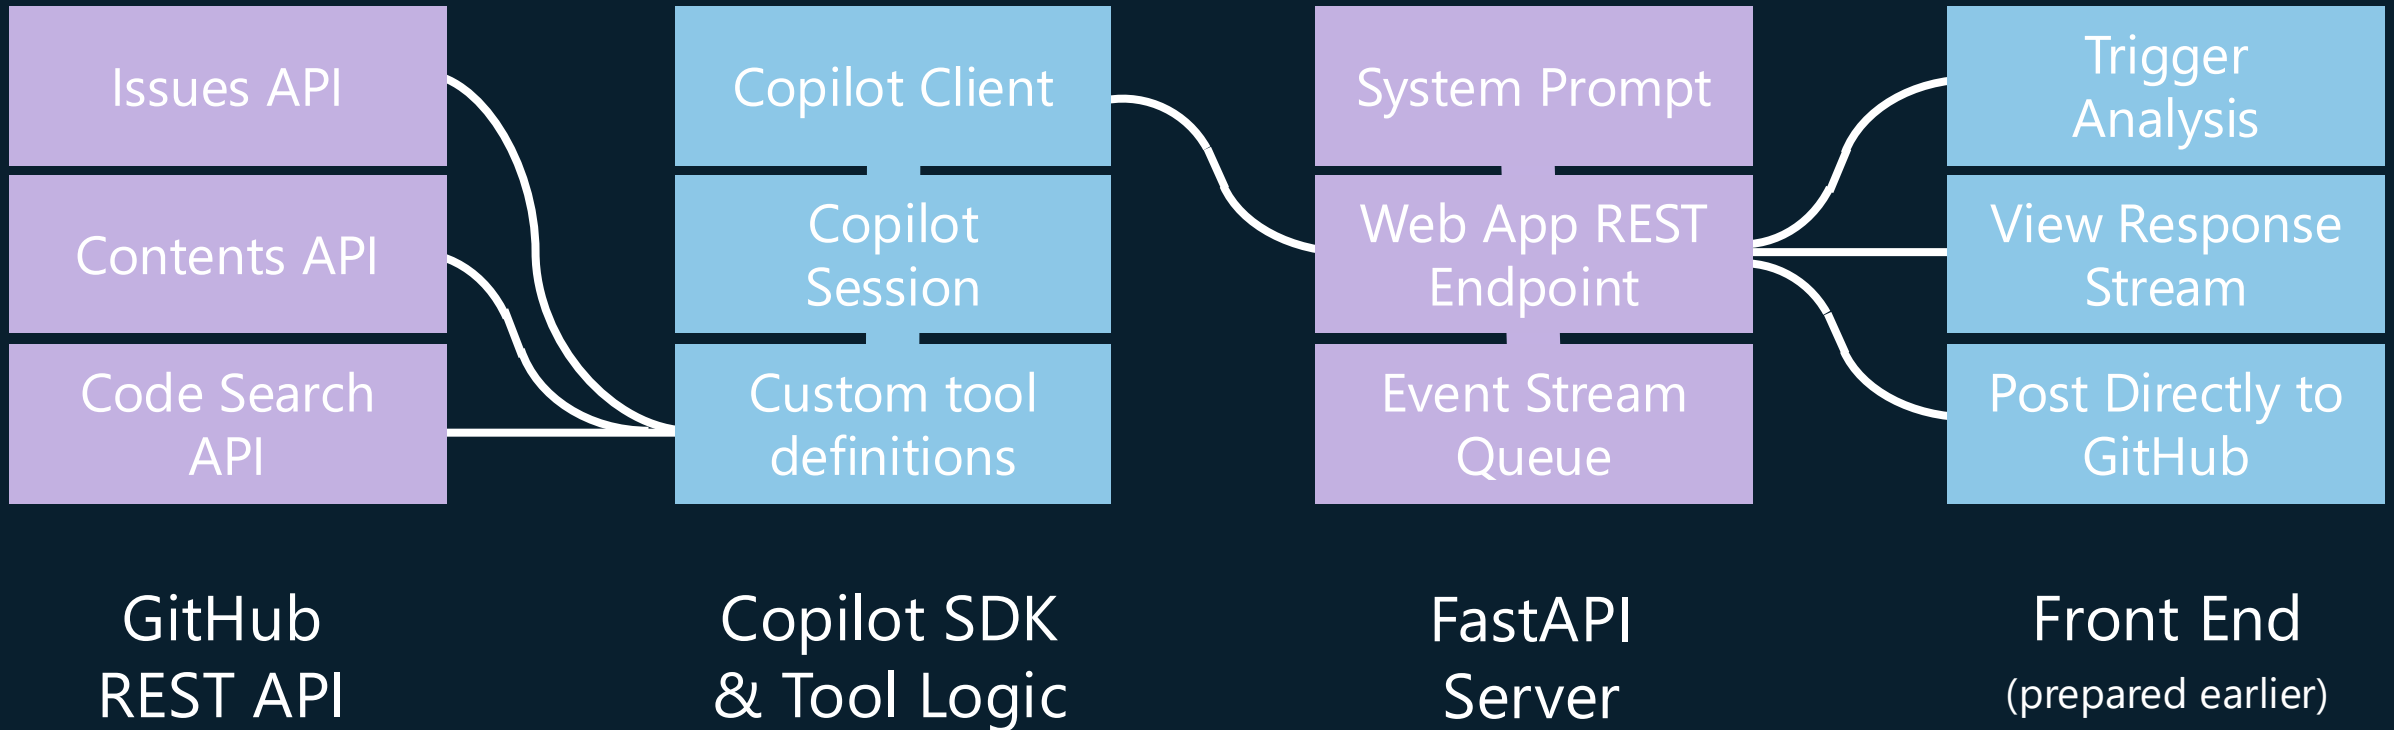

Loop, with the model increasing context and using tools until goal achieved

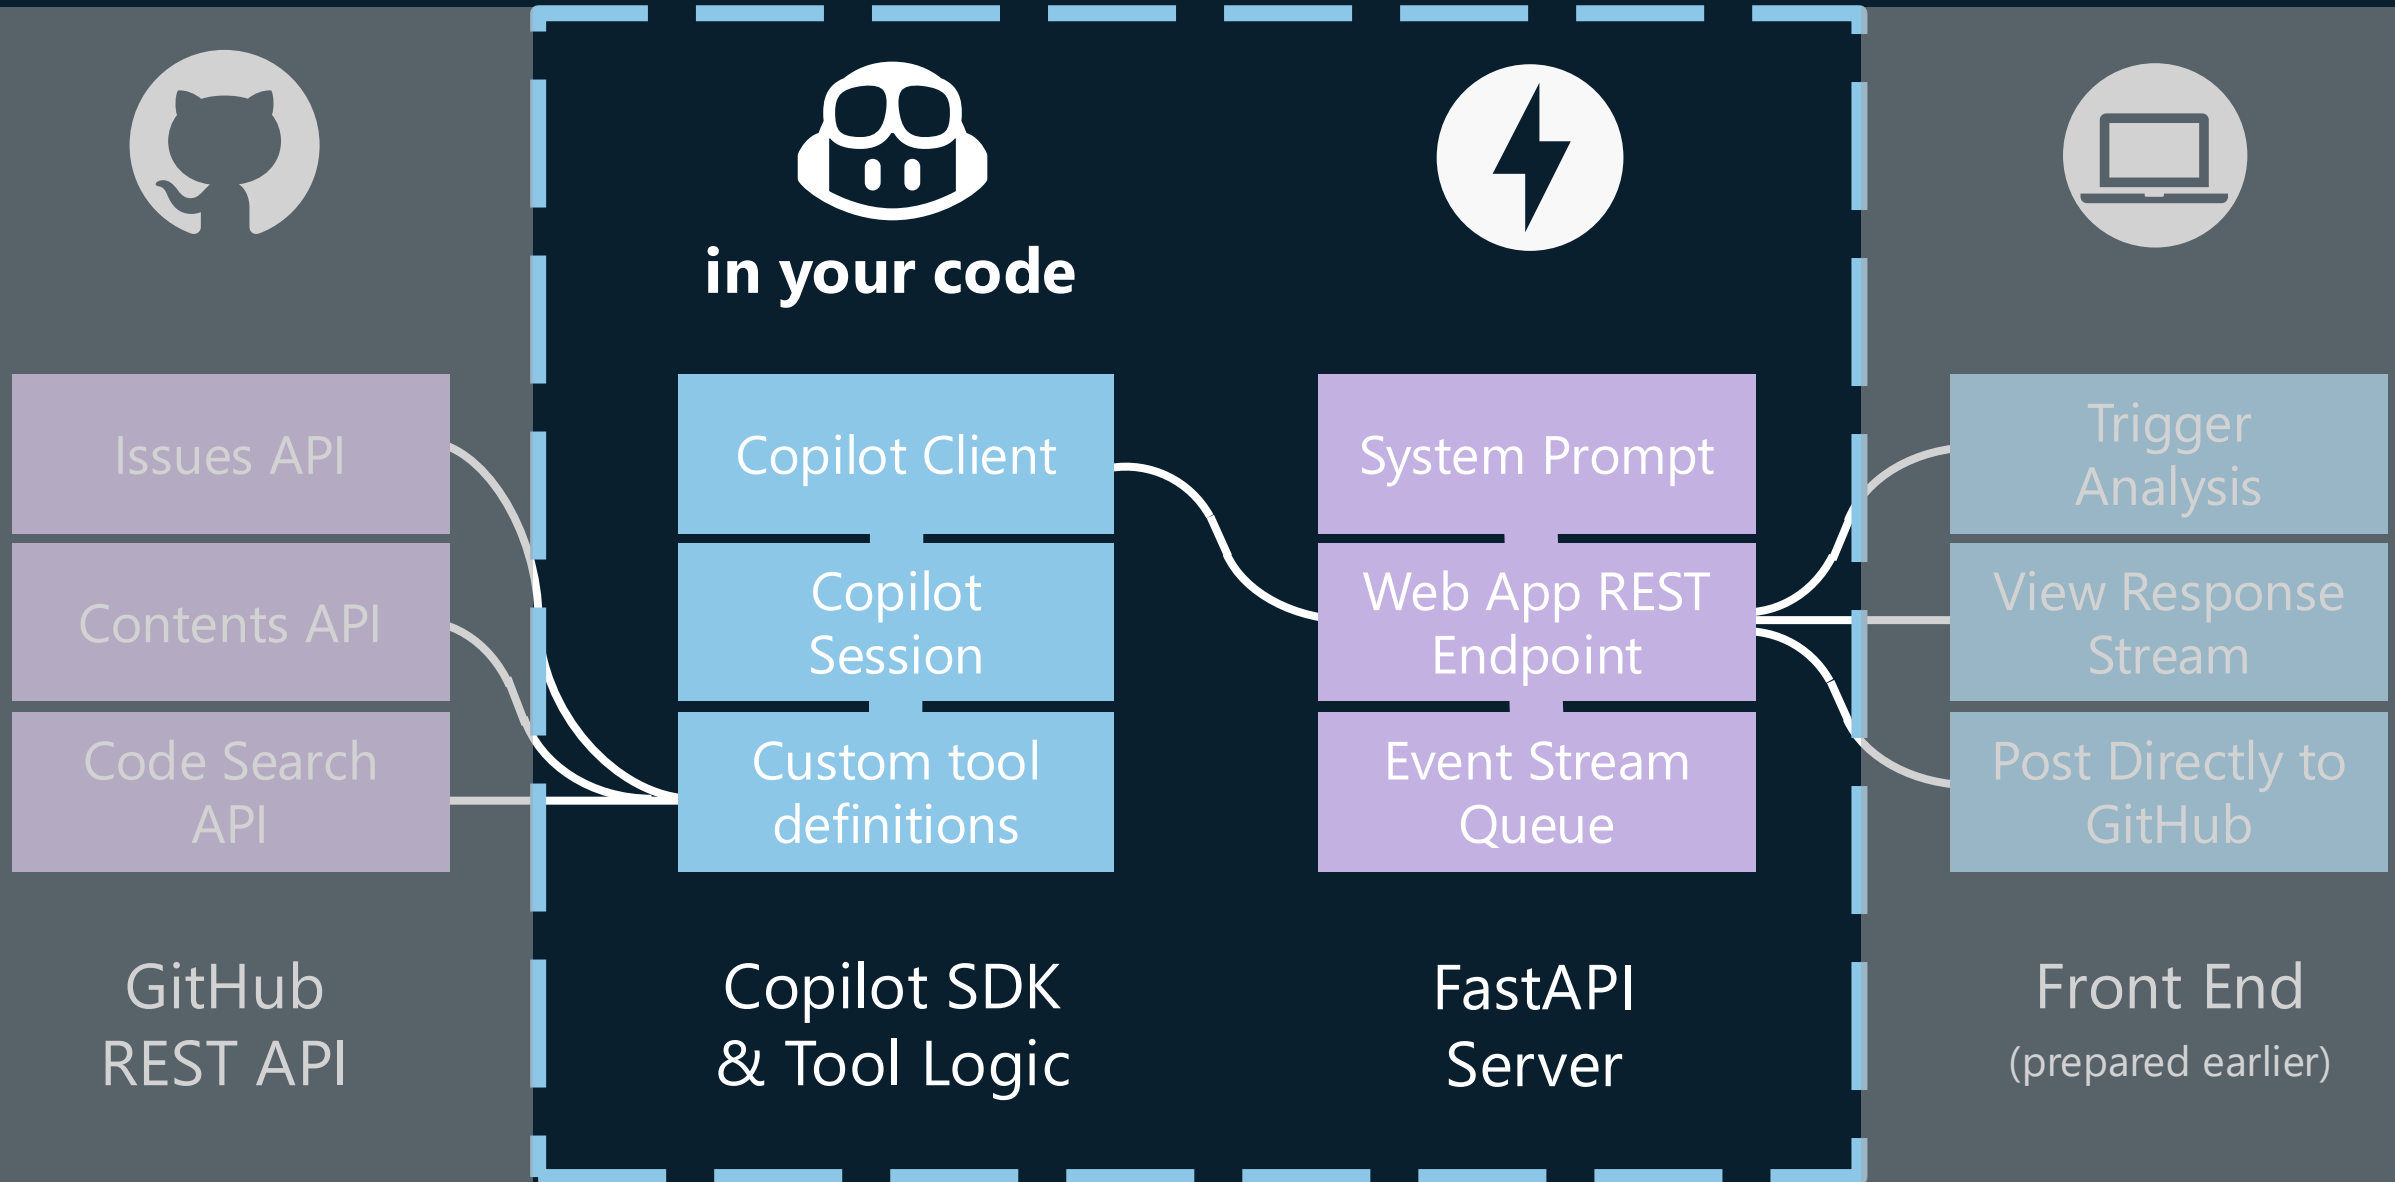

Building a GitHub Issue Analyser Web App

in your code

Building a GitHub Issue Analyser Web App
